Abstract

An output packet stream generator in a remodulator system includes a source of a stream of input transport packets and a source of additional packets. A multiplexer is coupled to the input transport packet stream source and the additional packet source and generates the output packet stream. A control signal has a variable characteristic having a first state when an input transport packet should be inserted into the output packet stream and a second state when additional packets should be inserted into the output packet stream. A multiplexer controller conditions the multiplexer to insert an input transport packet into the output packet stream when the control signal has the first state, and an additional packet into the output packet stream when the control signal

has the second state.
